ML-Assignment-5

#Question 1:

Principal Component Analysis
a. Applied PCA on CC dataset.
b. Applied k-means algorithm on the PCA result.
c. Perform Scaling+PCA+K-Means.

```

#Question-4

Difference between PCA & LDA:

1.Both LDA and PCA rely on linear transformations and aim to maximize the variance in a lower dimension. PCA is an unsupervised learning algorithm while LDA is a supervised learning algorithm. This means that PCA finds directions of maximum variance regardless of class labels while LDA finds directions of maximum class separability.

PCA: It reduces the features into a smaller subset of orthogonal variables, called principal components – linear combinations of the original variables. The first component captures the largest variability of the data, while the second captures the second largest, and so on.

LDA: LDA finds the linear discriminants in order to maximize the variance between the different categories while minimizing the variance within the class.
